

CSS Question-Answer Pairs

21 one-line answers for quick revision

Question	One-line Answer
1. Q: Explain the CSS :has() pseudo-class. Why is it called the parent selector?	A: :has() selects a parent element based on its child or sibling condition, so it is called the parent selector.
2. Q: What is CSS Subgrid? How does it solve alignment problems in nested grids?	A: Subgrid lets nested grid items follow the parent grid's rows or columns, keeping inner content aligned.
3. Q: Explain prefers-color-scheme and prefers-reduced-motion. How do they improve accessibility?	A: prefers-color-scheme detects dark/light mode, and prefers-reduced-motion reduces animations for users who need less motion.
4. Q: How does the CSS will-change property work? When should and shouldn't you use it?	A: will-change tells the browser an element will change soon, but it should be used only for specific animations, not permanently.
5. Q: What are CSS Logical Properties? Why should we use them over physical properties?	A: Logical properties use direction-aware terms like inline-start, making layouts better for LTR, RTL, and vertical writing.
6. Q: What is the CSS clamp() function? How is it different from min() and max()?	A: clamp() sets a value between minimum and maximum, while min() chooses the smaller value and max() chooses the larger value.
7. Q: What are CSS Cascade Layers @layer? How do they affect specificity?	A: Cascade layers organize CSS priority, where later layers can override earlier layers even with lower specificity.
8. Q: What are CSS Container Queries? How do they differ from Media Queries?	A: Container queries style elements based on container size, while media queries depend on viewport size.

9. Q: What is the CSS pointer-events property? What are its use cases?

A: pointer-events controls whether an element receives mouse or touch clicks, often used for overlays or disabled UI.

10. Q: What are text-overflow, word-wrap, and overflow-wrap? How do you handle text overflow?

A: These properties control long text by clipping, adding ellipsis, or breaking words to prevent layout overflow.

11. Q: What is the difference between max-width and width? Why does max-width matter for responsive design?

A: width sets a fixed size, while max-width sets a maximum limit and helps layouts stay responsive.

12. Q: What is the CSS transform property? Explain all transform functions.

A: transform visually moves, rotates, scales, skews, or changes elements in 2D/3D without affecting normal layout.

13. Q: How do CSS media queries work? Explain breakpoints and mobile-first approach.

A: Media queries apply CSS under conditions like screen width, and mobile-first starts with small screens then adds larger breakpoints.

14. Q: What is BEM methodology in CSS? Why is it popular?

A: BEM is a CSS naming method like block__element--modifier that keeps class names clean and maintainable.

15. Q: What are CSS transitions? How do they differ from CSS animations?

A: Transitions animate between two states, while animations use @keyframes for multi-step or looping effects.

16. Q: What is the CSS filter property? What effects can you achieve with it?

A: filter applies visual effects like blur, brightness, contrast, grayscale, opacity, and drop-shadow.

17. Q: What are the :is(), :where(), and :not() pseudo-class functions in CSS?

A: :is() groups selectors, :where() groups with zero specificity, and :not() selects elements that do not match.

18. Q: What is the object-fit property in CSS? Explain all its values.

A: object-fit controls how images or videos fit inside a container using fill, contain, cover, none, and scale-down.

19. Q: What is the rem unit in CSS? How is it different from em?

A: rem is based on the root font size, while em depends on the parent element's font size.

20. Q: Explain the CSS display property comprehensively. What are all the possible values?

A: display controls layout behavior using values like block, inline, inline-block, flex, grid, none, and more.

21. Q: What is CSS inheritance? Which properties are inherited and which are not?

A: CSS inheritance means text-related styles like color and font pass to children, but box-model styles like margin and padding usually do not.
